Torino, November 15, 2024

The birth of epidemic models

1927: Two Scottish biochemists Kermack and McKendrick propose a general mathematical model for the diffusion of epidemics. Most of the models used today are derived from Kermack and McKendrick's one.

The birth of epidemic models

1927: Two Scottish biochemists Kermack and McKendrick propose a general mathematical model for the diffusion of epidemics. Most of the models used today are derived from Kermack and McKendrick's one.

- ▶ Population divided into groups:
 - ▶ S susceptible people that are currently healthy and that can be infected
 - ▶ I infected people that can transmit the infection
 - ▶ R removed people that had the infection but that can no longer infect (because immune, or isolated or dead)
- ▶ Mechanism that describes how contagion takes place (pairwise interaction) and how a person becomes removed.

The most used epidemics models are known for their acronyms:

SI, SIS, SIR

SI epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$
- ▶ parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I\}$

SI epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$
- ▶ parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks

SI epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$
- ▶ parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$\begin{array}{ll} X_i(t^-) = S & X_j(t^-) = I \\ \text{otherwise } X(t) = X(t^-) \end{array} \quad \Longrightarrow \quad \underbrace{X_i(t) = I}_{\text{contagion}} \quad X_{-i}(t) = X_{-i}(t^-)$$

SI epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$
- ▶ parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$\begin{array}{ll} X_i(t^-) = S & X_j(t^-) = I \\ \text{otherwise } X(t) = X(t^-) \end{array} \quad \Longrightarrow \quad \underbrace{X_i(t) = I}_{\text{contagion}} \quad X_{-i}(t) = X_{-i}(t^-)$$

SIS epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I\}$

SIS epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ nodes $i \leftrightarrow$ independent rate-1 Poisson clocks

SIS epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ nodes $i \leftrightarrow$ independent rate-1 Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$\begin{array}{lll} X_i(t^-) = S & X_j(t^-) = I & \implies \underbrace{X_i(t) = I}_{\text{contagion}} \\ \text{otherwise } X(t) = X(t^-) & & X_{-i}(t) = X_{-i}(t^-) \end{array}$$

SIS epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ nodes $i \leftrightarrow$ independent rate-1 Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$\begin{array}{ll} X_i(t^-) = S & X_j(t^-) = I \\ \text{otherwise } X(t) = X(t^-) \end{array} \quad \Longrightarrow \quad \underbrace{X_i(t) = I}_{\text{contagion}} \quad X_{-i}(t) = X_{-i}(t^-)$$

- ▶ if node i -th clock ticks at time t then

$$\begin{array}{ll} X_i(t^-) = I & \\ \text{otherwise } X(t) = X(t^-) \end{array} \quad \Longrightarrow \quad \underbrace{X_i(t) = S}_{\text{recovery}} \quad X_{-i}(t) = X_{-i}(t^-)$$

SIR epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I, R\}$

SIR epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I, R\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ nodes $i \leftrightarrow$ independent rate-1 Poisson clocks

SIR epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I, R\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ nodes $i \leftrightarrow$ independent rate-1 Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$X_i(t^-) = S \quad X_j(t^-) = I \quad \implies \quad \underbrace{X_i(t) = I}_{\text{contagion}} \quad X_{-i}(t) = X_{-i}(t^-)$$

otherwise $X(t) = X(t^-)$

SIR epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I, R\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ nodes $i \leftrightarrow$ independent rate-1 Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$X_i(t^-) = S \quad X_j(t^-) = I \quad \implies \quad \underbrace{X_i(t) = I}_{\text{contagion}} \quad X_{-i}(t) = X_{-i}(t^-)$$

otherwise $X(t) = X(t^-)$

- ▶ if node i -th clock ticks at time t then

$$X_i(t^-) = I \quad \implies \quad \underbrace{X_i(t) = R}_{\text{recovery}} \quad X_{-i}(t) = X_{-i}(t^-)$$

otherwise $X(t) = X(t^-)$

SIRS epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I, R\}$

SIRS epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I, R\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ nodes $i \leftrightarrow$ independent rate-1 Poisson clocks

SIRS epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I, R\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ nodes $i \leftrightarrow$ independent rate-1 Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$\begin{array}{ll} X_i(t^-) = S & X_j(t^-) = I \\ \text{otherwise } X(t) = X(t^-) \end{array} \quad \implies \quad \underbrace{X_i(t) = I}_{\text{contagion}} \quad X_{-i}(t) = X_{-i}(t^-)$$

SIRS epidemics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{S, I, R\}$

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ nodes $i \leftrightarrow$ independent rate-1 Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$\begin{array}{ll} X_i(t^-) = S & X_j(t^-) = I \quad \implies \quad \underbrace{X_i(t) = I}_{\text{contagion}} \quad X_{-i}(t) = X_{-i}(t^-) \\ \text{otherwise } X(t) = X(t^-) & \end{array}$$

- ▶ if node i -th clock ticks at time t then

$$\begin{array}{ll} X_i(t^-) = I & \implies \quad \underbrace{X_i(t) = R}_{\text{recovery}} \quad X_{-i}(t) = X_{-i}(t^-) \\ X_i(t^-) = R & \implies \quad \underbrace{X_i(t) = S}_{\text{loss of immunity}} \quad X_{-i}(t) = X_{-i}(t^-) \\ \text{otherwise } X(t) = X(t^-) & \end{array}$$

Voter model

Pairwise interacting models are used in other contexts

- ▶ graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \mathcal{A}$ (*opinions*)

Voter model

Pairwise interacting models are used in other contexts

- ▶ graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \mathcal{A}$ (*opinions*)

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$\underbrace{X_i(t) = X_j(t^-)}_{\text{copy}} \quad X_{-i}(t) = X_{-i}(t^-)$$

Evolutionary dynamics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{0, 1\}$ (*competing species*)
- ▶ $f_0, f_1 \in [0, 1]$ (*fitness*)

Evolutionary dynamics

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \{0, 1\}$ (*competing species*)
- ▶ $f_0, f_1 \in [0, 1]$ (*fitness*)

The stochastic update law:

- ▶ links $(i, j) \leftrightarrow$ independent rate- βW_{ij} Poisson clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$\text{with probability } f_{X_j(t^-)} \quad \underbrace{X_i(t) = X_j(t^-)}_{\text{invasion}} \quad X_{-i}(t) = X_{-i}(t^-)$$

$$\text{with probability } 1 - f_{X_j(t^-)} \quad X(t) = X(t^-)$$

Pairwise interacting network systems

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \mathcal{A}$
- ▶ *mutation kernel*: stochastic matrix $\psi \in \mathbb{R}^{\mathcal{A} \times \mathcal{A}}$
- ▶ *interaction kernel*: stoc. mat. $\varphi(c) \in \mathbb{R}^{\mathcal{A} \times \mathcal{A}}$, $c \in \mathcal{A}$

Pairwise interacting network systems

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \mathcal{A}$
- ▶ *mutation kernel*: stochastic matrix $\psi \in \mathbb{R}^{\mathcal{A} \times \mathcal{A}}$
- ▶ *interaction kernel*: stoc. mat. $\varphi(c) \in \mathbb{R}^{\mathcal{A} \times \mathcal{A}}$, $c \in \mathcal{A}$
- ▶ nodes equipped with rate 1 clocks, edges with rate- βW_{ij} clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$X_i(t^-) = a \quad X_j(t^-) = c \quad \implies \quad \underbrace{X_i(t) = b}_{\text{interaction}} \text{ with prob. } \varphi_{a,b}(c)$$

Pairwise interacting network systems

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \mathcal{A}$
- ▶ *mutation kernel*: stochastic matrix $\psi \in \mathbb{R}^{\mathcal{A} \times \mathcal{A}}$
- ▶ *interaction kernel*: stoc. mat. $\varphi(c) \in \mathbb{R}^{\mathcal{A} \times \mathcal{A}}$, $c \in \mathcal{A}$
- ▶ nodes equipped with rate 1 clocks, edges with rate- βW_{ij} clocks
- ▶ if link (i, j) -th clock ticks at time t then

$$X_i(t^-) = a \quad X_j(t^-) = c \quad \implies \quad \underbrace{X_i(t) = b}_{\text{interaction}} \text{ with prob. } \varphi_{a,b}(c)$$

- ▶ if node i -th clock ticks at time t then

$$X_i(t^-) = a \quad \implies \quad \underbrace{X_i(t) = b}_{\text{mutation}} \text{ with prob. } \psi_{a,b}$$

Pairwise interacting network systems: examples

- SI Epidemics, $\mathcal{A} = \{S, I\}$

$$\psi = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \varphi(S) = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \varphi(I) = \begin{bmatrix} 0 & 1 \\ 0 & 1 \end{bmatrix}$$

- SIS Epidemics, $\mathcal{A} = \{S, I\}$

$$\psi = \begin{bmatrix} 1 & 0 \\ 1 & 0 \end{bmatrix} \quad \varphi(S) = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \varphi(I) = \begin{bmatrix} 0 & 1 \\ 0 & 1 \end{bmatrix}$$

- SIR Epidemics, $\mathcal{A} = \{S, I, R\}$

$$\psi = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix} \quad \varphi(S) = \varphi(R) = Id \quad \varphi(I) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Pairwise interacting network systems: examples

- ▶ Voter model

$$\psi = Id \quad \varphi(c) = \mathbb{1}(\delta^{(c)})^T$$

- ▶ Evolutionary dynamics

$$\psi = Id \quad \varphi(c) = (1 - f_c)I + f_c \mathbb{1}(\delta^{(c)})^T$$

Pairwise interacting network systems

- ▶ (undirected) graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, parameter $\beta > 0$
- ▶ nodes $i \in \mathcal{V}$ have state $X_i(t) \in \mathcal{A}$
- ▶ *mutation kernel*: stochastic matrix $\psi \in \mathbb{R}^{\mathcal{A} \times \mathcal{A}}$
- ▶ *interaction kernel*: stoc. mat. $\varphi(c) \in \mathbb{R}^{\mathcal{A} \times \mathcal{A}}$, $c \in \mathcal{A}$

$X(t)$ cont.-time Markov chain over *configuration space* $\mathcal{X} = \mathcal{A}^{\mathcal{V}}$
with transition rates

$$\Lambda_{xy} = \begin{cases} 0 & \text{if } x_i \neq y_i \text{ for more than one } i \\ \psi_{x_i y_i} + \beta \sum_j W_{ij} \varphi_{x_i y_i}(x_j) & \text{if } x_i \neq y_i \text{ and } x_{-i} = y_{-i} \end{cases}$$

\mathcal{G}_{Λ} graph describing the non-zero transition probability rates in \mathcal{X} .

Extensions: *heterogenous nodes* with different mutation and interaction kernels.

Warning: two graphs not to be confused!

- ▶ The graph \mathcal{G} describing the interaction among nodes
- ▶ The graph \mathcal{G}_Λ in the configuration space

Example:

\mathcal{G}

The corresponding \mathcal{G}_Λ for the SI epidemics model

Warning: two graphs not to be confused!

- ▶ The graph \mathcal{G} describing the interaction among nodes
- ▶ The graph \mathcal{G}_Λ in the configuration space

Example:

 \mathcal{G} 

The corresponding \mathcal{G}_Λ for the SIS epidemics model

Absorbing configurations

$\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$ connected, $\beta > 0$

In all the examples considered, $X(t)$ is not ergodic (e.g. \mathcal{G}_Λ is not connected). **There exist absorbing configurations:**

- ▶ SI Epidemics: $\{\text{absorbing config.}\} = \{S\mathbb{1}, I\mathbb{1}\}$
- ▶ SIS Epidemics: $\{\text{absorbing config.}\} = \{S\mathbb{1}\}$
- ▶ SIR Epidemics: $\{\text{absorbing config.}\} = \{S, R\}^\mathcal{V}$
- ▶ Voter model, Ev. Dyn.: $\{\text{absorbing config.}\} = \{c\mathbb{1} : c \in \mathcal{A}\}$

Fact: from every initial configuration, there exists a walk in the configuration graph leading to an absorbing configuration (**exercise**)

Consequence: with probability 1 in finite time, the process $X(t)$ will be absorbed in one of the absorbing configurations

Absorbing configurations

$\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$ connected, $\beta > 0$

- ▶ SI Epidemics: $\{\text{absorbing config.}\} = \{S\mathbb{1}, I\mathbb{1}\}$
- ▶ SIS Epidemics: $\{\text{absorbing config.}\} = \{S\mathbb{1}\}$
- ▶ SIR Epidemics: $\{\text{absorbing config.}\} = \{S, R\}^{\mathcal{V}}$
- ▶ Voter model, Ev. Dyn.: $\{\text{absorbing config.}\} = \{c\mathbb{1} : c \in \mathcal{A}\}$

Questions:

- ▶ expected absorbing time for SI and SIS
- ▶ absorbing probabilities for SIR, voter and evolutionary dynamics

For general graphs the computation or estimation of most of these quantities is a challenging problem.

Binary Pairwise Interacting Systems

- ▶ $\mathcal{A} = \{0, 1\}$, $\beta > 0$, $\varphi_{ab}(a) = 0 \ \forall a \neq b \in \{0, 1\}$, $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$
- ▶ $N(t) = \sum_i X_i(t)$ = number of 1's

Binary Pairwise Interacting Systems

- $\mathcal{A} = \{0, 1\}$, $\beta > 0$, $\varphi_{ab}(a) = 0 \ \forall a \neq b \in \{0, 1\}$, $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$
- $N(t) = \sum_i X_i(t)$ = number of 1's **not a Markov chain in general**:

$$\lambda_k(x) = (n - k)\psi_{0,1} + \zeta_+(x)\beta\varphi_{01}(1) \quad \mu_k(x) = k\psi_{1,0} + \zeta_-(x)\beta\varphi_{10}(0)$$

depend on both k and **active** in- and out-boundaries:

$$\zeta_+(x) = \sum_{i,j} W_{ij}(1 - x_i)x_j, \quad \zeta_-(x) = \sum_{i,j} W_{ij}x_i(1 - x_j)$$

Binary Pairwise Interacting Systems

- ▶ $\mathcal{A} = \{0, 1\}$, $\beta > 0$, $\varphi_{ab}(a) = 0 \ \forall a \neq b \in \{0, 1\}$, $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$
- ▶ $N(t) = \sum_i X_i(t)$ = number of 1's **not a Markov chain in general**:

$$\lambda_k(x) = (n - k)\psi_{0,1} + \zeta_+(x)\beta\varphi_{01}(1) \quad \mu_k(x) = k\psi_{1,0} + \zeta_-(x)\beta\varphi_{10}(0)$$

depend on both k and **active** in- and out-boundaries:

$$\zeta_+(x) = \sum_{i,j} W_{ij}(1 - x_i)x_j, \quad \zeta_-(x) = \sum_{i,j} W_{ij}x_i(1 - x_j)$$

- ▶ $N(t)$ **birth-and-death chain** in those **special cases** where $\zeta_+(x)$, $\zeta_-(x)$ are function of $k = \sum_i x_i$
- ▶ E.g., $\mathcal{G} = K_n$ complete $\implies \zeta_+(x) = \zeta_-(x) = k(n - k)$

Absorbing time for SI on the star graph

- Star graph with only center node initially infected: $N(0) = 1$

Absorbing time for SI on the star graph

- ▶ $N(t) = 1$
- ▶ active boundary: $\zeta_+(X(t)) = n - 1$
- ▶ Expected time to next infection $1/(n - 1)\beta$

Absorbing time for SI on the star graph

- ▶ $N(t) = 2$
- ▶ active boundary: $\zeta_+(X(t)) = n - 2$
- ▶ Expected time to next infection $1/(n - 2)\beta$

Absorbing time for SI on the star graph

- ▶ $N(t) = 3$
- ▶ active boundary: $\zeta_+(X(t)) = n - 3$
- ▶ Expected time to next infection $1/(n - 3)\beta$

Absorbing time for SI on the star graph

- ▶ $N(t) = k$
- ▶ active boundary: $\zeta_+(X(t)) = n - k$
- ▶ Expected time to next infection $1/(n - k)\beta$

Absorbing time for SI on the star graph

- ▶ $N(t) = k$
- ▶ active boundary: $\zeta_+(X(t)) = n - k$
- ▶ Expected time to next infection $1/(n - k)\beta$

Absorbing time for SI on the star graph

- ▶ $N(t) = k$
- ▶ active boundary: $\zeta_+(X(t)) = n - k$
- ▶ Expected time to next infection $1/(n - k)\beta$

Absorbing time for SI on the star graph

- ▶ $N(t) = k$
- ▶ active boundary: $\zeta_+(X(t)) = n - k$
- ▶ Expected time to next infection $1/(n - k)\beta$

Absorbing time for SI on the star graph

- ▶ $N(t) = n - 1$
- ▶ active boundary: $\zeta_+(X(t)) = 1$
- ▶ Expected time to next infection $1/\beta$

Absorbing time for SI on the star graph

- ▶ $N(t) = n$
- ▶ active boundary: $\zeta_+(X(t)) = 0$
- ▶ reached full infection

Absorbing time for SI on the star graph

- Expected time to full infection

$$\begin{aligned}\mathbb{E}[T|X(0) = (1 \dots 0)] &= \frac{1}{\beta(n-1)} + \frac{1}{\beta(n-2)} + \dots + \frac{1}{\beta} \\ &= \frac{1}{\beta} \sum_{k=1}^{n-1} \frac{1}{n-k} = \frac{1}{\beta} \sum_{k=1}^{n-1} \frac{1}{k} \\ &= \frac{H_{n-1}}{\beta} \sim \frac{\log n}{\beta}\end{aligned}$$

Absorbing time for SI on the ring graph

Absorbing time for SI on the ring graph

Absorbing time for SI on the ring graph

Absorbing time for SI on the ring graph

- Expected time to full infection

$$\mathbb{E}[T|X(0) = \delta^{(i)}] = \frac{1}{2\beta} + \frac{1}{2\beta} + \dots \frac{1}{2\beta} = \frac{n-1}{2\beta}$$

Absorbing time for SI on the complete graph

Expected absorbing time: $X(t) = I\mathbb{1} \Leftrightarrow N(t) = n$

► $N(t) = k \Rightarrow$ active boundary: $\zeta_+(X(t)) = k(n - k)$

► Expected time to next infection $1/\beta$

$$\tau_n = 0 \quad \tau_k = \frac{1}{k(n - k)\beta} + \tau_{k+1}, \quad 0 \leq k < n$$

Absorbing time for SI on the complete graph

Expected absorbing time: $X(t) = I\mathbb{1} \Leftrightarrow N(t) = n$

► $N(t) = k \Rightarrow$ active boundary: $\zeta_+(X(t)) = k(n - k)$

► Expected time to next infection $1/\beta$

$$\tau_n = 0 \quad \tau_k = \frac{1}{k(n-k)\beta} + \tau_{k+1}, \quad 0 \leq k < n$$

$$\tau_1 = \sum_{k=1}^{n-1} \frac{1}{k(n-k)\beta} = \frac{2}{\beta n} \sum_{k=1}^{n-1} \frac{1}{k} \sim \frac{2}{\beta} \frac{\log n}{n}$$

Extinction time for SIS epidemics on the complete graph

- ▶ $N(t)$ continuous-time birth-and-death chain:

$$\mu_k(x) = k, \quad 1 \leq k \leq n, \quad \lambda_k(x) = \beta k(n - k), \quad 1 \leq k < n$$

- ▶ unique globally reachable absorbing state 0

Extinction time for SIS epidemics on the complete graph

- ▶ $N(t)$ continuous-time birth-and-death chain:

$$\mu_k(x) = k, \quad 1 \leq k \leq n, \quad \lambda_k(x) = \beta k(n - k), \quad 1 \leq k < n$$

- ▶ unique globally reachable absorbing state 0
- ▶ expected extinction times $\tau_k = \mathbb{E}[T_0 | N(0) = k]$ satisfy

$$\tau_0 = 0 \quad \tau_k = \frac{1 + k\tau_{k-1} + \beta k(n - k)\tau_{k+1}}{k + \beta k(n - k)} \quad \tau_n = \frac{1}{n} + \tau_{n-1}$$

Extinction time for SIS epidemics on the complete graph

- $N(t)$ continuous-time birth-and-death chain:

$$\mu_k(x) = k, \quad 1 \leq k \leq n, \quad \lambda_k(x) = \beta k(n-k), \quad 1 \leq k < n$$

- unique globally reachable absorbing state 0
- expected extinction times $\tau_k = \mathbb{E}[T_0 | N(0) = k]$ satisfy

$$\tau_0 = 0 \quad \tau_k = \frac{1 + k\tau_{k-1} + \beta k(n-k)\tau_{k+1}}{k + \beta k(n-k)} \quad \tau_n = \frac{1}{n} + \tau_{n-1}$$

- **Proposition:** SIS epidemics on K_n , $\beta = \alpha/n$. Then,

$$(i) \quad \alpha < 1 \implies \tau_k \leq \tau_n \sim \frac{\log n}{1 - \alpha}$$

$$(ii) \quad \alpha > 1 \implies \tau_k \geq \tau_1 \sim \frac{e^{ng(\alpha)}}{\alpha n}$$

$$g(\alpha) = \max_{\frac{1}{\alpha} \leq \gamma \leq 1} (1 - \gamma) \log(\alpha\gamma) > 0$$

SIS on general graph

► **Theorem:** Consider the SIS epidemics on a connected undirected graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$. Then,

$$\beta\lambda_W < 1 \quad \implies \quad \mathbb{E}_x[T_0] \leq \frac{1 + \log n}{1 - \beta\lambda_W} \quad \forall x \in \mathcal{X}$$

SIS on general graph

► **Theorem:** Consider the SIS epidemics on a connected undirected graph $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$. Then,

$$\beta\lambda_W < 1 \quad \implies \quad \mathbb{E}_x[T_0] \leq \frac{1 + \log n}{1 - \beta\lambda_W} \quad \forall x \in \mathcal{X}$$

► The existence of a slow extinction regime depends on other connectivity properties of a graph. It can be investigated for some special graph families (e.g., Erdos-Renyi random graphs)

Fixation probability for evolutionary dynamics

► **Theorem:** Evolutionary dynamics on connected $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, binary states $\{0, 1\}$, fitness ratio $\rho = f_1/f_0$. If \mathcal{G} **undirected**, then

$$\mathbb{P}_x \left(\lim_{t \rightarrow +\infty} X(t) = \mathbb{1} \right) = \begin{cases} k/n & \text{if } \rho = 1 \\ \frac{1 - \rho^{-k}}{1 - \rho^{-n}} & \text{if } \rho \neq 1 \end{cases}$$

where $k = \sum_i x_i$.

Fixation probability for evolutionary dynamics

► **Theorem:** Evolutionary dynamics on connected $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, binary states $\{0, 1\}$, fitness ratio $\rho = f_1/f_0$. If \mathcal{G} **undirected**, then

$$\mathbb{P}_x \left(\lim_{t \rightarrow +\infty} X(t) = \mathbb{1} \right) = \begin{cases} k/n & \text{if } \rho = 1 \\ \frac{1 - \rho^{-k}}{1 - \rho^{-n}} & \text{if } \rho \neq 1 \end{cases}$$

where $k = \sum_i x_i$.

► **Proof:** $N(t)$ is not a continuous-time Markov chain ...

Fixation probability for evolutionary dynamics

► **Theorem:** Evolutionary dynamics on connected $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, binary states $\{0, 1\}$, fitness ratio $\rho = f_1/f_0$. If \mathcal{G} **undirected**, then

$$\mathbb{P}_x \left(\lim_{t \rightarrow +\infty} X(t) = \mathbb{1} \right) = \begin{cases} k/n & \text{if } \rho = 1 \\ \frac{1 - \rho^{-k}}{1 - \rho^{-n}} & \text{if } \rho \neq 1 \end{cases}$$

where $k = \sum_i x_i$.

► **Proof:** $N(t)$ is not a continuous-time Markov chain ...

... but has the same absorbing probabilities as its jump chain

where $p = f_1/(f_0 + f_1)$ and $q = f_0/(f_0 + f_1)$.

Fixation probability for evolutionary dynamics (cont'd)

► **Theorem:** Evolutionary dynamics on connected $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$, binary states $\{0, 1\}$, fitness ratio $\rho = f_1/f_0$. If \mathcal{G} **undirected**, then

$$\mathbb{P} \left(\lim_{t \rightarrow +\infty} X(t) = \mathbb{1} | X(0) \right) = \begin{cases} k/n & \text{if } \rho = 1 \\ \frac{1 - \rho^{-k}}{1 - \rho^{-n}} & \text{if } \rho \neq 1 \end{cases}$$

where $k = \sum_i X_i(0)$.

► Biological interpretation: if you start with a native population of 0's and introduce a single genetic mutant 1 with evolutionary advantage $f_1 > f_0$, then the probability the mutant specie 1 replaces the native specie 0 is

$$\mathbb{P} \left(\lim_{t \rightarrow +\infty} X(t) = \mathbb{1} | X(0) \right) = \frac{1 - \rho^{-1}}{1 - \rho^{-n}}$$

independently from the position of the initial mutant.

Absorbing probabilities for the voter model

► **Theorem:** Voter model on connected $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$. Then,

$$\mathbb{P}_x \left(\lim_{t \rightarrow +\infty} X(t) = a \mathbb{1} \right) = \sum_{i: x_i = a} \bar{\pi}_i$$

where $\bar{\pi}$ is the **Laplace-invariant distribution** of \mathcal{G} .

Absorbing probabilities for the voter model

► **Theorem:** Voter model on connected $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$. Then,

$$\mathbb{P}_x \left(\lim_{t \rightarrow +\infty} X(t) = a \mathbb{1} \right) = \sum_{i: x_i = a} \bar{\pi}_i$$

where $\bar{\pi}$ is the **Laplace-invariant distribution** of \mathcal{G} .

► **Proof:** $p_i^a(t) = \mathbb{P}_x(X_i(t) = a)$ satisfies $p_i^a(0) = \delta_{x_i}^{(a)}$ and

$$\frac{d}{dt} p_i^a(t) = \beta \sum_{j \in \mathcal{V}} W_{ij} (p_j^a(t) - p_i^a(t))$$

so that $\frac{d}{dt} \sum_i \bar{\pi}_i p_i^a(t) = 0$. Then

$$\sum_{i: x_i = a} \bar{\pi}_i = \sum_i \bar{\pi}_i p_i^a(0) = \sum_i \bar{\pi}_i p_i^a(t) \xrightarrow{t \rightarrow +\infty} \mathbb{P}_x \left(\lim_{t \rightarrow +\infty} X(t) = a \mathbb{1} \right)$$

Absorbing probabilities for the voter model

► **Theorem:** Voter model on connected $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$. Then,

$$\mathbb{P}_x \left(\lim_{t \rightarrow +\infty} X(t) = a \mathbb{1} \right) = \sum_{i: x_i = a} \bar{\pi}_i$$

where $\bar{\pi}$ is the **Laplace-invariant distribution** of \mathcal{G} .

► **Corollary:** Voter model on connected **balanced** $\mathcal{G} = (\mathcal{V}, \mathcal{E}, W)$. Then,

$$\mathbb{P}_x \left(\lim_{t \rightarrow +\infty} X(t) = a \mathbb{1} \right) = \frac{1}{n} |\{i \in \mathcal{V} : x_i = a\}|$$

► **Proof:** in balanced connected graph $\bar{\pi}$ is uniform

► \mathcal{G} undirected $\Rightarrow \pi$ uniform (c.f. previous result in case $|\mathcal{A}| = 2$)

Final number of recovered for SIR epidemics on line graph

- ▶ Let N = total nr of nodes in final state R
- ▶ If $X(0) = x \in \{I, S\}^{\mathcal{V}}$, then N = total nr of nodes that get infected at some time
